The bike sharing demand is calculated using various variables like 'Date', 'Rented Bike Count', 'Hour', 'Temperature(°C)', 'Humidity(%)', 'Wind speed (m/s)', 'Visibility (10m)', 'Dew point temperature(°C)', 'Solar Radiation (MJ/m2)', 'Rainfall(mm)', 'Snowfall (cm)', 'Seasons', 'Holiday', and Functioning Day. These values are treated for null values at first, then the EDA part is carried out to enhance the normality of the data, to determine the correlation between the variables and finally the multicollinearity is checked between the variables. Each of the variables are defined below:

Date : year-month-day

Rented Bike count - Count of bikes rented at each hour

Hour - Hour of the day

Temperature-Temperature in Celsius

Humidity - %

Wind Speed - m/s

Visibility - 10m

Dew point temperature - Celsius

Solar radiation - MJ/m2

Rainfall - mm

Snowfall - cm

Seasons - Winter, Spring, Summer, Autumn

Holiday - Holiday/No holiday

Functional Day - NoFunc(Non Functional Hours), Fun(Functional hours)

The problem has been carried out by handling the null values and Exploratory Data Analysis. In these steps I used algorithms like ExtraTree classifier to check the results of each feature i.e which feature is more important compared to our model and which is of less importance. Our main motive through this step was to scale our data into a uniform format that would allow us to utilize the data in a better way while performing fitting and applying different algorithms to it.

The basic goal was to enforce a level of consistency or uniformity to certain practices or operations within the selected environment. Then the problem is modelled using different models such as Linear Regression, Decision Tree Regressor, Random Forest Classifier, Gradient Boosting Machine and XGBoost Regressor with Cross validators as GridSearchCV, RandomSearchCV and Bayesian Optimizer.

The best R-Squared value is estimated to be 0.922 in the OLS model and 0.906 in the XGBoost Model.

I have applied SHAP value plots on the Random Forest model to determine the features that were most important while model building and the features that didn't put much weight on the performance of our model.

The most important features are estimated with the help of SHAP library in the XGBoost model with Bayesian Optimisation and those are shown in the below image:
